Reliable and adaptable cabling solutions for the education sector

As ICT needs grow and change in the education sector, most decision makers would agree that flexibility and reliability are key considerations when selecting new products. What if you need to add more PCs to an existing ICT area? Will the equipment you've chosen be adaptable enough to meet curriculum needs in the future? Which products have the best balance of quality and value and are tough enough to withstand the demands of the classroom over time?

HellermannTyton, with operations in 32 countries, is a leading designer and manufacturer of network connectivity and cable management products. It designs, manufactures and supplies a wide range of structured cabling solutions, all backed by a 25 year warranty when installed by an HellermannTyton-accredited installer.

HellermannTyton has been providing cabling solutions to schools, further education colleges and universities across the UK for 18 years. By investing heavily in research and development at their Northampton manufacturing facility, HellermannTyton is able to offer customers unrivalled service, and can adapt and design products quickly to meet individual needs.

One product proving popular with the education sector is Coolport, a three-port outlet that enables up to two PCs to be connected to one four-pair cable. Alternatively the units can be used to connect either two telephones, or one

telephone and a PC. It also allows added capacity in difficult-to-cable buildings and can reduce disruption during network expansions.

Peter Hawtin, Product Manager at HellermannTyton, said: “Coolport is an ideal cabling solution for schools because of its flexibility, making it easier to reconfigure ICT areas or put in additional equipment. It is very easy to install and use.

“Even in the best designed systems there are always one or two areas where you wish you had more connectivity. With Coolport you can add the connectivity with minimal cost.”

Sold in pairs, one can be mounted onto a desk or wall, with the other linked to a patch panel, using launch leads. Each Coolport features high specification components: the PCBs are designed by HellermannTyton and the RJ45 jacks used are of the highest quality. Each unit undergoes rigorous testing at HellermannTyton’s factory and is backed by a 25 year warranty.
